

BRANDBOOK

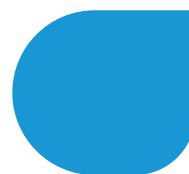

MARK

The **GVS mark** consists of two elements:

- the GVS logotype in grey;
- the pictogram depicting the liquid and the drop in light blue.

The letter V, inside the mark, represents the image of a dropper and makes the pictogram clearer and more recognisable.

ON A GREY BACKGROUND

The buffer area is the minimum distance that a mark must maintain from graphical elements and text boxes to remain readable.

The buffer area of the GVS mark is equal to the space occupied by the drop of the pictogram.

For the GVS mark to remain legible, it is advisable not to reduce the height beyond the 1.5 cm dimension.

Shrinking the mark beyond this limit would make the GVS logo difficult to read and the pictogram unclear.

To ensure the recognisability of the visual identity of GVS in the communication media, the use of the trademark is suggested with its institutional colours: light blue and grey.

When the background consists of a dark or elaborate image, it is recommended that a white graphic element (vector shape, gradient transparency) is placed behind the mark to keep its legibility intact.

In some cases, the use of the GVS mark in the white variant is necessary to remain legible and recognisable.

For example:

- the background is black;
- the background is light blue or grey (or a lighter or darker of these two colours);
- the background has a strong visual impact but encloses a very dark and detailed image.

HOW **NOT** TO USE THE GVS MARK

To comply with the criterion of recognisability of a trade mark, you should never:

- change colours;
- overlap shades;
- distort the shape;
- add a sharp or shaded outline;
- use photographic or 3D effects.
